## MySQL::Optimize Lookup Tables

OPTIMIZE TABLE is not a supported feature for InnoDB tables. OPTIMIZE TABLE can be run to defragment tables in the MyISAM storage engine. But note that defragmentation with OPTIMIZE TABLE may cause data loss. Therefore, before defragmentation, it is advisable to run the MySQL backup utility. If InnoDB tables do not have fragmentation issues and you want to generate InnoDB fulltext indexes, use the MySQL fulltext module. The MySQL fulltext module creates a look-up table that can be used to index a table for fast access. Once the table has the index, MySQL automatically updates the index whenever the underlying table is altered. OPTIMIZE TABLE works by detecting tables that are fragmented and returning indexes for these tables. An index rebuild is triggered if the number of rows in the table exceeds a certain threshold. MySQL Server automatically optimizes tables. But you can use OPTIMIZE TABLE to optimize tables that already have been created. OPTIMIZE TABLE adds a . OPTIMIZE TABLE Reorganizes the data and index structures of a table so that the structure will use less space within the file. The reorganization can be done either before or after MySQL starts up. In MySQL InnoDB, a . OPTIMIZE TABLE reorganizes the data files and indexes and reorganizes the table to use less space. The MySQL Optimize Table Optimizer searches for tables that are too large and not too many rows. It then reorganizes these tables, building tables that are smaller, use less disk space, and, in the case of MyISAM storage engine, have more efficient internal structure. An . The MySQL InnoDB engine does not do any fragmentation-related work on data that is already in tables. But for tables without such data, MySQL automatically compacts data if it is fragmented, which means it does not keep the tables fragmented. OPTIMIZE TABLE splits a table into multiple parts. OPTIMIZE TABLE causes the server to compress and reorganize tables. The MySQL InnoDB engine does not do any fragmentation-related work on data that is already in tables. But for tables without such data, MySQL automatically compacts data if it is fragmented, which means it does not keep the tables fragmented. OPTIMIZE TABLE keeps a memory-efficient index that you can use to search for data in a table. To give
